ANGULAR LAB 2 - PAUPER'S REDDIT

Task: Create a webpage that displays the posts from the AWW Subreddit.

Build Specifications

1. Create an Angular Service to request data from the https://www.reddit.com/r/aww/.json API.
2. Create an Interface for a single result—at a minimum, a title, image, and link for each post.
   - Easiest image is to use the thumbnail for the image, but there are other images in the JSON response.
   - It's best to make an interface for the entire result as well, with an array inside it for the children, and then the "single result" interface above models 1 of those children.
3. Display the results on the page—have a component for the list and a component for a single result.
   - Display the image and make the link active (to the website—prepend https://www.reddit.com/ and put it before the permalink string.
   -

Extended Challenges

- Provide 10 results per page
- Provide an input and button where the user can enter the name of a subreddit to display instead of always aww

Tests

1. Displays multiple aww results, each including at least the title.
2. Each post includes an image (if it has one).
3. Each post includes a link to the post on the reddit website.
4. At least 20 lines of CSS applied to spruce up the page.
